

Incident report analysis

Instructions

As you continue through this course, you may use this template to record your findings after completing an activity or to take notes on what you've learned about a specific tool or concept. You can also use this chart as a way to practice applying the NIST framework to different situations you encounter.

Summary	Our company experienced a DoS attack when a large number of ICMP packets flooded the network. This caused network services to stop responding for about two hours. The team blocked the traffic and restored critical services.
Identify	This was an ICMP flood DoS attack. The attack targeted the company's internal network and took advantage of a firewall configuration issue.
Protect	To better protect the network, we should update firewall rules, verify IP addresses, and regularly review firewall settings. Using an IDS/IPS can also help block suspicious traffic.
Detect	We can detect similar attack by monitoring network traffic, reviewing logs, and using IDS/IPS tools to identify unusual activity and traffic spikes.
Respond	If this happens again, the team should quickly block malicious traffic, investigate logs, identify the source of attack, and follow the incident response plan to reduce downtime.
Recover	After the attack is contained, network services should be restored and monitored to ensure everything is working normally. Security controls should also be reviewed and improved.

Reflections/Notes: This activity helped me understand how the NIST cybersecurity Framework can be used to identify, protect, detect, respond to, and recover from security incidents.
